PRESENTER COPY / 3 MINUTES INCLUDING DEMO

FarmLens

Your land, your climate, your best crops, with the reasons.
Follow the bold cues and use your own words.
QUESTION → LAND → WEATHER → CROPS → WATER → NEXT STEPS

0:00-0:20 / The question

ON SCREEN: Start on the prepared Dubbo Land overview.

Hi everyone, this is **FarmLens**.

It starts with a question: **what could I grow on this land?**

There's a lot to consider, from the soil to the weather and available water.

FarmLens brings those pieces together, so you've got a clearer place to start.

0:20-0:55 / Start with the land

ON SCREEN: Point to the selected location, then Land snapshot; stay on Dubbo.

Let me show you around.

I've picked **Dubbo**, but you can search or choose a spot on the NSW map.

When a place name is available, the app helps you recognise the area.

First, this **land snapshot** shows mapped land cover and estimated soil conditions.

The cover label comes from satellite mapping for **2025**.

It's a first look at the location, rather than a farm inspection.

0:55-1:20 / Put the weather in context

ON SCREEN: Point to Seven-day weather; briefly expand Seasonal climate, then scroll down.

Next, let's look at the weather.

Here's the **seven-day forecast**, with daily rain and temperatures.

And here are the **seasonal patterns**, showing longer-term rainfall and temperature.

That helps separate what's coming this week from what's typical across the year.

You can check the dates and sources as you go.

> **Before the timer:** prepare Dubbo and the Wheat / May water result.
> Full setup and fallback instructions are in the editable script.

Crop options, water and the next step

1:20-1:50 / Explore the crop options

ON SCREEN: Scroll to Explore crop options; open one candidate, then close it.

With that picture in mind, we can explore crop options.

Choose whether you're exploring the land or thinking about a planting month.

Then open a crop to see **why it appears**, and what needs checking.

The score helps compare options, but it doesn't guarantee success.

The aim is to give you better questions to take to a local expert.

1:50-2:30 / Ask about water

ON SCREEN: Open the prepared Wheat / May water result; point to assumptions and the poster chart.

One of those questions is: would there be enough water?

This separate tool compares **ten past growing seasons** using assumptions you can change.

Here, the same wheat setup shows a bigger water gap at **Broken Hill** than Dubbo.

You can explore how soil-water storage and crop timing affect the result.

The starting values are examples, rather than measurements from the selected farm.

It's historical context alongside the crop shortlist, and doesn't change its rankings.

2:30-3:00 / Close with the purpose

ON SCREEN: Return to Land overview or the poster; keep the disclaimer visible.

So, what's next for FarmLens?

The prototype now connects the land snapshot, weather, crop choices and water questions.

There are **automated checks**, and the next step is feedback from agronomists.

I'd also like to compare the results with real farm measurements.

The goal is a **clearer starting point**, with reasons you can follow.

Indicative only.

Check with a local agronomist.

If a request takes over five seconds, switch to the recorded screenshot and name it as a saved example. Use the poster for Broken Hill.

The 60-second version

0-12s: Mike + build · 12-30s: users + problem · 30-52s: Dubbo + crop · 52-60s: close

Hi everyone, I'm **Mike**, a **Master of Data Science student at UTS**.

For today's **six-hour build**, I'm creating **FarmLens**.

It's for **NSW farmers and landowners** exploring what crops could suit their land.

Weather, soil and crop information is scattered, making it hard to know where to start.

FarmLens brings it together and explains **why each crop appears**.

Let me show you.

Here's **Dubbo**, with a land snapshot and the weather outlook.

Scrolling down, I can explore crop options and open one to see **the reasons**.

There's also a water tool to explore different assumptions.

The goal is a **clearer starting point** for local advice.

Indicative only.

Check with a local agronomist.

Thank you!

Demo facts to keep beside you

- Dubbo wheat / May: 255 mm median demand; 60 mm additional net water; 0.75 ML/ha median gross irrigation.
- Defaults: 100 mm buffer, 50 mm starting water, 80% rain infiltration, 80% irrigation efficiency, 150 crop days.
- Land cover: 2025 satellite context, 30 m pixel. Seven-day weather is forecast; seasonal charts are historical. Neither land cover nor the water pilot changes rankings.
- Missing pH withholds the shortlist. OpenAI and FIRMS credentialed live responses are outside this demo.

Fallback and evidence

Use the recorded land-overview, pin-place-name, crop-profile-assets and water-feasibility screenshots under docs/screenshots. These are recorded views. Full demo setup, Q&A, source links and licences are in the accompanying Markdown script and sources-and-notes.md.

> **Indicative only. Check with a local agronomist.**
